

Ocean and Biosphere Uptake of CO2 - Expectations

Bruce Parker (bruce@chesdata.com)

July 28, 2018

<http://ccdatacenter.org/documents/CO2UptakeExpectations.pdf>

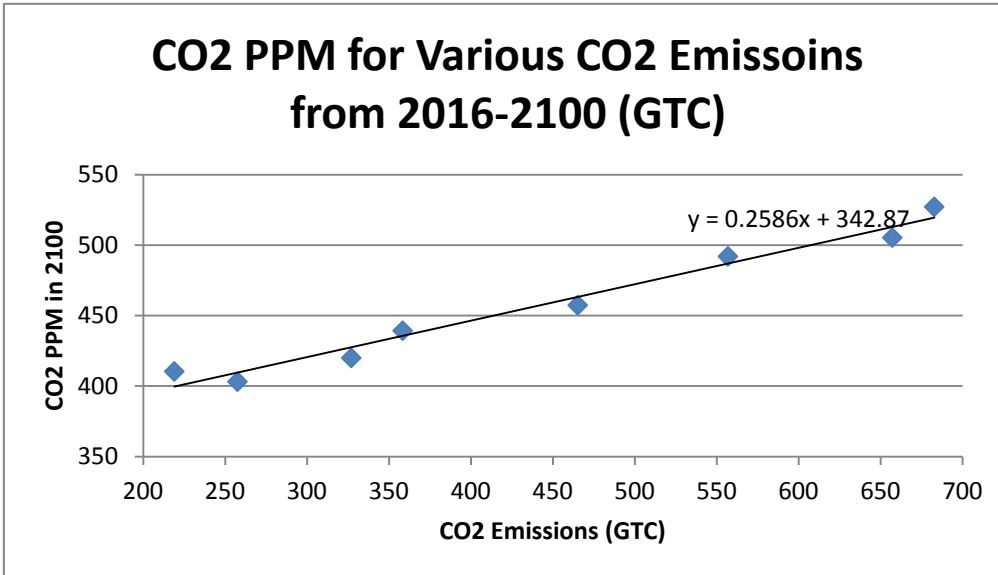

- The ocean and biosphere currently absorb about 55% of anthropogenic CO2 emissions¹
- The amount absorbed varies greatly from year to year and will likely decrease later this century^{2,3,4}
- For the case where the CO2 removed by CDR do not exceed the CO2 emissions, the relationship between total CO2 emitted this century and atmospheric CO2 in 2100 is close to linear in both the MAGICC and C-ROADS models, allowing a CO2 "budget" to be specified for an equilibrium temperature, climate sensitivity, and amount of non-radiative forcing in 2100^{5,6,7} by using the formula:

$$\text{CO2 Budget} = (278 * e((5.35 * \ln(1 + ET / CS) - \text{NonCO2RF}) / 5.35) - 342.87) / 0.2586$$

- If we can limit net emissions to about 250 GTC, the ocean and biosphere will absorb all of the emitted CO2 and atmospheric CO2 will eventually return to the current level^{5,6,7}
